

2807/7001ICT Programming Principles (I), Trimester 3, 2018

Workshop 7

School of Information and Communication Technology
Griffith University

November 7, 2018

<i>Module</i>	3
<i>When</i>	Day 7
<i>Goals</i>	This workshop focusses on everything in the course up to files.
<i>Marks</i>	5
<i>Due</i>	Problem 1 by the end of this workshop; problems 2 to 4 by the <i>beginning</i> of the next workshop.

1 Preparation

Before your workshop class:

- Read all of this document.
- Review the lecture notes sections 1 to 20.
- Bring some paper (a print-out of this document is best) and writing implements.
- Bring a storage device, such as a portable hard drive and cable, or a USB drive.

2 Pre-workshop questions (1 mark)

Complete these questions in writing *before* the start of the workshop. They will be marked early in the workshop.

1. Give two differences between a tuple and a list.
2. Give an important difference between an array in an older language, such as C, and a list in Python.
3. Complete this table, if the following statements have already been executed. Try to work it out yourself, before confirming with the REPL.

```
i = 3
s = 'robin'
xs = [5, 4, 3, 2, 1]
t = (i, xs, s, False)
```

<i>expression</i>	<i>type</i>	<i>value</i>
<code>i</code>	<code>int</code>	<code>3</code>
<code>s[0]</code>		
<code>xs[2]</code>		
<code>xs[i]</code>		
<code>t[3]</code>		
<code>xs[-1]</code>		
<code>xs[-3]</code>		
<code>s[1:]</code>		
<code>s[1:3]</code>		
<code>s[1:-2]</code>		
<code>xs[:-1]</code>		
<code>xs[0:2]</code>		
<code>t[1][1]</code>		
<code>t[2][:2]</code>		

3 Workshop activities

3.1 Marking last workshop's problems

If you have problems that still need marking from the previous workshop, get them marked at the *start* of this one.

3.2 Problem 1 (1 mark)

Problem: The Unix tool `head` prints only the top few lines of a file. Write your own version of `head` that prompts for the name of the file to read, and the number of lines to print. For example:

```
File name: Lear.txt
Lines: 9
I
The Owl and the Pussy-cat went to sea
    In a beautiful pea-green boat,
They took some honey, and plenty of money,
    Wrapped up in a five-pound note.
The Owl looked up to the stars above,
    And sang to a small guitar,
"O lovely Pussy! O Pussy, my love,
    What a beautiful Pussy you are,
```

If the file has fewer lines than requested, print as many as there are.

Hint: You don't need to store all the lines in memory before printing them.

3.3 Problem 2 (1.5 marks)

This problem and the rest are due at the beginning of the next workshop. *Ask any questions you have about the problems NOW!*

Problem: The Unix tool `wc` counts the numbers of characters, words and lines in a file. Write your own version of `wc` that prompts for the name of the file to read, then prints the counts. For example:

```
File name: Lear.txt
Characters: 1242
Words: 224
Lines: 38
```

Hint: You don't need to store all the lines in memory before counting.

3.4 Problem 3 (1.5 marks)

Problem: Write a program that prompts for the name of a file containing numbers, one per line, and prints the average (arithmetic mean) and the median. For example:

```
File name: scores.txt
Average = 24.5
Median = 25.5
```

4 After the workshop

- You have created programs that might be useful to refer back to in future workshops. Make sure that you will have that work in the future. One copy is not enough for an IT professional. You should have at least 2 copies:
 1. on your Griffith network storage drive; and
 2. on your portable storage device.
- Please answer these feedback questions.
 - What was the best aspect of this workshop?
 - What was the most difficult or worst aspect of this workshop?
 - Did you find an error in these workshop notes?
